Doug,

Glad to hear. I would suggest two groups of clustering variables:

- a. For socioeconomic status: median income, white population and age
- b. For settlement type: population density, intersection density and people using single private vehicles

We don't have the centroids but they can be derived using the GISJOIN and the census track columns. Let me know if you want that we get that for you.

Paty

Subject: Locations of census block centers

Paty,

Could read in the data for CO no problem and it looks like it will be easy to work with.

>>> Can you suggest a group of variables to test out clustering?

>>> Do you know if you have the locations of the census block locations. E.g. the lon/lat centroids?
